This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

#### Research highlights

- An optimization method that couples a genetic algorithm with thermal and daylight simulations is presented and applied to the design of a school building in China.
- The double-sided corridor design shows the best performance in the cold climate of China while the one-sided enclosed corridor type is the least suitable.
- The best passive design parameters for each spatial configuration are presented.
