Solar water heating system and photovoltaic floating cover to reduce evaporation:
Experimental results and modeling

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Editor-in-Chief
Renewable Energy

Highlights:

- An experimental study on a novel system solar water heating system is described.
- Water evaporation reduction was achieved through floating modules.
- Photovoltaic cells mounted on floating modules can be used in small copper processing plants at remote locations.
- Meteorological data over eight months of continuous operation were in very good agreement with measured data.
