This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- This work investigates thermal performance of solar parabolic trough which its absorber fill with the copper foam
- An increase in the Nu number and friction factor are experimentally determined.
- An enhancement in performance is observed by increasing mass flow
- The copper foam slightly improves the heat solar collector performance
