This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Practice Parameter for the Assessment and Treatment of Children and Adolescents With
Reactive Attachment Disorder and Disinhibited Social Engagement Disorder
Development and Attribution**

RH = AACAP Official Action

**Charles H. Zeanah, MD; Tessa Chesher, DO; Neil Boris, MD; and the American Academy
of Child and Adolescent Psychiatry (AACAP) Committee on Quality Issues (CQI)**

This Parameter was developed by Charles H. Zeanah, MD, Tessa Chesher, DO, Neil Boris, MD, and the American Academy of Child and Adolescent Psychiatry (AACAP) Committee on Quality Issues (CQI): Heather J. Walter, MD, MPH, and Oscar G. Bukstein, MD, MPH, co-chairs; and Christopher Bellonci, MD, R. Scott Benson, MD, Regina Bussing, MD, Allan Chrisman, MD, John Hamilton, MD, Munya Hayek, MD, Helene Keable, MD, Carol Rockhill, MD, Matthew Siegel, MD, and Sandra Stock, MD.

The AACAP Practice Parameters are developed by the AACAP CQI in accordance with American Medical Association (AMA) policy. Parameter development is an iterative process among the primary author(s), the CQI, topic experts, and representatives from multiple constituent groups, including the AACAP membership, relevant AACAP committees, the AACAP Assembly of Regional Organizations, and the AACAP Council. Details of the Parameter development process can be accessed on the AACAP Web site. Responsibility for Parameter content and review rests with the author(s), the CQI, the CQI Consensus Group, and the AACAP Council.

The AACAP develops both patient-oriented and clinician-oriented Practice Parameters. Patient-oriented Parameters provide recommendations to guide clinicians toward best assessment and treatment practices. Recommendations are based on the critical appraisal of empirical evidence (when available) and clinical consensus (when evidence is unavailable), and are graded according to the strength of the empirical and clinical support. Clinician-oriented Parameters provide clinicians with the information, stated as principles, needed to develop practice-based skills. Although empirical evidence may be available to support certain principles, principles are primarily based on clinical consensus. This Parameter is a patient-oriented Parameter.
