Abstract

Social anxiety disorder symptoms are generally proposed to be related to broad temperamental vulnerabilities (e.g., a low level of approach and high level of avoidance temperament), specific psychological vulnerabilities (e.g., fears of negative and positive evaluation), and additional disorders (e.g., major depressive disorder). However, existing tests of such a model have either

¹ Justin Weeks is now at the Department of Psychology at Nebraska Medical Center.

² Patrick J. Brown is now at the Department of Psychiatry at Columbia University College of Physicians and Surgeons.
