In-hospital outcomes and delayed neurologic sequelae of seizure-related endosulfan poisoning

Moon JM1, Chun BJ1, Lee SD1.

**1Department of Emergency Medicine, Chonnam National University Medical School,
Gwangju, South Korea**

Highlight

- Seizures related to endosulfan poisoning were investigated
- Patients showed rapid progression from status epilepticus (SE) to refractory SE (RSE)
- The Glasgow coma scale might predict progression from SE to RSE
- Patients did not develop delayed neurologic sequelae for six months after discharge
- Lorazepam should be considered as a first-line antiepileptic drug

ABSTRACT

Purpose: This study investigated the predictive factors for progression from seizure-related endosulfan poisoning to status epilepticus (SE) and refractory SE (RSE). This study also investigated delayed neurologic sequelae in seizure-related endosulfan poisoning.
