This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Research Highlights

- Performance on the virtual cooking task was associated with multiple cognitive measures
- Performances in the virtual task were highly representative of what participants did in real life
- This tool is a first step toward including ecologically valid measures for a comprehensive assessment of healthy elderly controls
- The serious game has the potential to be used as a multitasking assessment tool for cognition and performances in an activity of daily living
