This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Estimates of the returns to education vary according to questionnaire design, but not according to who reports the information.
- The differences are substantial: 5 percentage points higher among the most highly educated men and 16 percentage points higher among the least well educated women.
- These differences are similar in magnitude to the bias in ordinary least squares estimation and to the differences by gender, educational attainment, and sectors.
