This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We develop a novel prognostic method for estimating the *RUL* and its uncertainty.
- The novelty is the combination of fuzzy similarity and Belief Function Theory.
- The method is applied to simulated and real data in ferritic steel and condenser filters.
- Results show that the proposed method is superior to other alternative methods.
- The method aids the maintenance planner to confidently schedule maintenance actions.
