This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- In this research UCI Indian Liver Patient Dataset (ILPD) used.
- Boosted C5.0 and CHAID algorithms are used to identify liver disease risk factors.
- This research shows females have more chance of liver disease than males.
- Common risk factors of liver disease were extracted by data mining.
- This research were produced quite simple rules.
