Abstract

A fractional-order adaptive fuzzy controller, capable of guaranteeing prescribed performance, is designed for a class of uncertain fractional-order nonlinear systems with external disturbances in this paper. With respect to the prescribed performance control, we mean that the system variables converge to an arbitrary small region of the origin with convergence rate no less than a certain prescribed function. Fuzzy logic system is utilized to approximate an unknown nonlinear function which contains fractional-order terms. Based on the Lyapunov stability criterion, a fractional-order adaptive fuzzy sliding mode controller, which can guarantee the stability of the closed-loop system as well as the prescribed performance, is constructed. Finally, simulation results are given to confirm our results.

Keywords: Adaptive fuzzy control, fractional-order nonlinear system, prescribed performance control, fractional-order controller.

1. Introduction

Recently, fractional-order systems have received more and more interests from physicists and engineers due to their several interesting properties and potential applications [1, 2, 3, 4]. In reality, lots of actual systems show fractional-order differential dynamical behavior because of special materials and chemical
