This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- A multi-server queue model is proposed for cloudlets to extract system performance parameters.
- A resource allocation mechanism is proposed for two level mobile cloud computing architecture with an offload mechanism.
- A hybrid heuristic algorithm for task assignment in mobile cloud computing is proposed, using Ant Colony optimization and genetic algorithm. The algorithm balances the load and reduces average completion time of all the tasks.
