This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We study equilibrium computation of multi-player anonymous games.
- We extend and develop the general theory of query-efficiency of multi-player games.
- We obtain improved computational efficiency, as well as query efficiency.
- Our main result leads to a new polynomial-time approximation scheme.
- We exhibit an anonymous game whose exact equilibria require irrational numbers.
