This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A novel scheduling strategy for broadcast latency minimization in duty-cycled WSNs
- Allowing collision at non-critical nodes to speed up the broadcast process for critical ones
- The completion of broadcast scheduling is ensured by additionally transmitting a message to non-critical nodes experiencing collision
- Achieving significant improvements in both theoretical analysis and simulation results
