This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The paper proposes several manual modeling techniques for planning problems.
- The models exploit a structured state representation and control knowledge.
- Planning domain models for Nomystery and Cave Diving domains are presented in Picat.
- Experimental comparison with domain-dependent and PDDL planners is presented.
