This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A position-based incremental approach is established for soft tissue deformation based on the principle of work-energy balance.
- The proposed method employs nonlinear geometric and material formulations to account for nonlinear soft tissue deformation.
- Integration with a haptic device is achieved for soft tissue deformation with haptic feedback for surgical simulation.
- Isotropic and anisotropic deformations and soft tissues' viscoelastic behaviours can be accommodated via strain energy density functions.
