This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We propose a novel approach with the use of the angle of view of nodes to early route packets around holes on escape routes.
- We provide a proof to show that the Euclidean stretch of an escape route is bounded.
- We show that the exploitation of the knowledge on routing holes can lead to an efficient operation.
