This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- The combination of optimal oriented flux and oriented flux antisymmetry measures is used to yield slenderized vessels
- A thin-vessel centerline extraction method is proposed based on height ridge traversal and leaf node line-growing
- Our method can effectively extract thin vessels
- Our method can identify hepatic vein and portal vein
