This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- A local search-based algorithm that incorporates a mechanism for adapting the neighborhood size during the course of the search is developed for the post-enrollment-based course timetabling problem.
- The trade-off between exploration and exploitation during search can be controlled simply by adjusting the neighborhood size.
- The proposed local search-based algorithm with an appropriate updating strategy for the neighborhood size and neighborhood structure obtains highly competitive performance compared with the leading solvers developed for the well-known Socha et al., ITC-2002, and ITC-2007 benchmark sets, despite its simplicity.
