This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We present the General Lot-Sizing and Scheduling Problem under uncertainty
- For the first time, we study a budget-uncertainty set robust optimization model
- A scenario-based two-stage stochastic programming model is also analyzed
- The benefit of each approach is assessed via a Monte Carlo simulation procedure
- We provide guidelines to select the most suitable model based on managers' preferences
