This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

A highly scalable parallel solution for the SSP on GPU that substantially reduces the memory access by the device and, consequently, decreases the total runtime.

Tests with only hard instances, which require the exhaustion of the entire search space, instead of simple random benchmarks.

Only algorithm in the literature that solves hard instances of the SSP with 100,000 items limited to 10^6 and 200 items limited to 10^8 in feasible time.

Excellent runtimes outperforming the best-known practical and parallel algorithms.
