Optimal trade execution under endogenous pressure to liquidate:
Theory and numerical solutions

Pavol Brunovský, Aleš Černý, Ján Komadel

PII: S0377-2217(17)30697-5
DOI: [10.1016/j.ejor.2017.07.054](https://doi.org/10.1016/j.ejor.2017.07.054)
Reference: EOR 14604

To appear in: *European Journal of Operational Research*

Received date: 20 January 2017
Revised date: 27 June 2017
Accepted date: 23 July 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- New look at optimal liquidation when fast sale pushes price against the seller
- Negative price drift induces endogenous pressure to liquidate
- Liquidation time horizon not fixed but modelled by a stopping time
- Study of extremely singular ODE IVP with a proposal for a stable numerical scheme
- Confirms square-root law for per-share impact of a block order
