This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Comprehensive modelling of quality decay in network design for perishable products.
- Heterogeneity in quality can be actively used to match product flows with demands.
- Quality decay causes an upstream move of the customer order decoupling point.
- Changing product quality decay rates affects the level of postponement.
- Numerical results based on fresh produce supply chain in the floricultural sector.
