This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- We consider a single machine scheduling problem under a JIT objective.
- We describe structural properties of the problem and dominance properties among jobs.
- These properties are incorporated within a branch-and-cut procedure.
- The proposed algorithm is able to solve instances with up to 300 jobs within reduced running times.
