This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We consider demand-weighted distance criterion to evaluate routing solutions.
- We present a formulation based on a pseudo-polynomial time dynamic program.
- We employ a column generation method and develop a new class of cuts.
- We test our model with actual student demand data from the University of Cincinnati
