This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- This article proposes a solution to technology replacement policy and capacity plan of resources.
- The problem is modelled by stochastic dynamic programming and integer programming.
- The objective is to maximize the expected net present profit over a finite time horizon.
- The problem is solved by a pattern search-genetic algorithm.
- Experiment results indicate that a near optimal solution can be achieved in finite time.
