This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Bounds the performance (fraction late arrivals) of online ambulance dispatching
- The ‘closest idle method performs 2.7 times worse than the offline optimum
- The DMEXCLP dispatch heuristic is only 1.9 times worse than the offline optimum
- The value of information for realistic instances is thus lower than one may expect
- The competitive ratio for the dispatch problem is infinitely large
