This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A concave least squares problem has $O(n^2)$ constraints that is very difficult to solve.
- A penalization method for concave least squares problem is proposed.
- The penalized method is formulated as a non-negative unconstrained QP.
- The reformulated QP is solved much faster than the original problem.
- The dual of the reformulated problem is a separable QP and has a superior computational performance.
- Matlab and R codes for solving the reformulated problem and its dual are presented.
