This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

1. We have integrated free air cooling into the hybrid cooling system. While the conference version considers only liquid cooling, we have extended the paper to consider a novel and timely problem: Coordination with free air cooling.
2. We have presented new evaluation results in three new experimental subsections and test our scheme from more perspectives.
3. We have added detailed discussion about different cooling techniques.
