This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We develop a multi-degree polar spline framework with applications to both geometric modeling and isogeometric analysis.
- Multi-degree splines are introduced as piecewise NURBS of non-uniform polynomial degree, and a simple and practical algorithm for their construction is presented.
- An extension to two-dimensional polar configurations is provided by means of a tensor-product construction with a collapsed edge.
- A mathematically rigorous framework for construction of C^k smooth polar splines for any $k \geq 0$ is presented. Explicit constructions for $k \in \{0, 1, 2\}$ are given.
- We show that it is always possible to construct a set of smooth polar spline basis functions that form a convex partition of unity.
- Optimal approximation behavior is observed numerically and examples of applications to free-form design, smooth hole-filling, and high-order partial differential equations are shown.
