This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights (for review)**

- A rapid isogeometric design space exploration framework providing the user with a full-system response is presented.
- Within this framework, a surrogate model to a PDE system solution vector is constructed using a nodal or modal polynomial expansion in the design variables and associated sampling schemes based on tensor-product and sparse quadrature.
- Several numerical examples are presented within the context of structural mechanics, demonstrating the effectiveness of the proposed framework.
