This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- A color-gradient LBM is developed for immiscible axisymmetric multiphase flows.
- The method consists of three separate operators in which axisymmetric effects are considered.
- The method is demonstrated to be accurate for a very wide range of viscosity ratios.
- Viscosity ratio is found to affect significantly growth of Rayleigh instability but have negligible effect on droplet size.
