High-Performance Aerodynamic Computations for Aerospace Applications

Eric J. Nielsen, Boris Diskin

PII: S0167-8191(17)30018-2
DOI: [10.1016/j.parco.2017.02.004](https://doi.org/10.1016/j.parco.2017.02.004)
Reference: PARCO 2366

To appear in: *Parallel Computing*

Received date: 28 July 2016
Revised date: 16 January 2017
Accepted date: 8 February 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A recent study outlining a NASA vision for computational fluid dynamics (CFD) development emphasizes the importance of high-performance computing (HPC) in increasing the impact of CFD on design and certification of aerospace vehicles.
- Broader use of CFD in aerospace applications has been limited by its inability to accurately predict turbulent separated flows.
- This paper presents recent experiences with the development, implementation, and application of a large-scale solver for turbulent flow simulations in HPC environments and discusses computational challenges and opportunities pertaining to aerospace computations.
