This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The method detects moving objects in a set of digital images with various exposures
- The method does not rely on camera response function, object detection, reference image
- It is a per-image, per-patch, adaptive approach functional in a wide range of scenes
- It detects continuous or sudden movements of small or large objects within a scene
- It can be further developed for object tracking within different frames of a video
