This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Our main contribution is to enhance trackers by leveraging observation uncertainty in terms of mutual information.
- As another contribution, we theoretically underpin that the observation uncertainty problem can be resolved by three image processing techniques: background subtraction, saliency detection, and extracting illumination-invariant (intrinsic) intensities.
- Our approach can be plugged into any kind of visual trackers.
