This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A new consensus model for social network group decision making problems is presented
- A novel minimum adjustment cost feedback mechanism to generate recommendations is defined
- A social network analysis methodology to represent and model trust degrees is defined
- Trust degrees are used as importance degrees to characterize the value of experts.
