This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- This paper presents a new recurrent based facial landmark detection method for images and videos under uncontrolled conditions.
- LSTM model is employed in our network to make full use of the spatial and temporal middle stage information in a natural way.
- The results show clear improvement on public image datasets and video datasets.
