This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A novel algorithm based on random forests with surrogate splits is proposed to address the classification problem of incomplete data without imputation.
- The algorithm allows each tree to cast a vote even the voting process is interrupted by missing attributes.
- Experimental results on various acknowledged datasets show that the proposed method is robust and efficient.
