This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Research Highlights (Required)

.

It should be short collection of bullet points that convey the core findings of the article. It should include 3 to 5 bullet points (maximum 85 characters, including spaces, per bullet point.)

- This study addresses modeling non-linear dependency in multi-label classification by utilizing Choquistic regression.
- The Choquistic regression is a well-established model to detect non-linear dependencies.
- We propose a hyper model equipped by Choquistic regression.
- It allows to model positive and negative interactions on the use of label dependence.
- .
