This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- We propose a novel approach to generate topic-specific data flow signatures. The approach, which considers both descriptions and data flow information of apps, yields effective data flow patterns and helps better comprehend malicious apps.
- We conduct an empirical study on 3,269 apps to demonstrate the benefits of topic-specific data flow signatures.
