Abstract : The health standard *Health Level 7-Service-Aware Interoperability Framework* (HL7-SAIF) is the most popular and widely-used healthcare-related standard in global operation today. Originally introduced as *HL7* in 1987 and recently melded with the *SAIF* technology, the standard has been *embraced* by the *National Health Services* of the most developed economies in Europe, North and South America, and Australasia.

However, the standard is not without issues. Its current version *v3* which supports *Semantic Interoperability*, the overarching and meaningful exchange of healthcare information amongst participating healthcare enterprises, has been found to be difficult to implement and maintain. A principle component of the *HL7-SAIF v3* development paradigm
