This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- Particle clustering dynamics induced by vibrations in a non-isothermal liquid are studied.
- The multiplicity of particle attractors is not a constant number.
- New shapes of the particle attractors become possible when the vibrations are inclined
- The 3D breakdown in the symmetry of solutions is also studied.
