This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- The solidification process around two tandemly-arranged circular cylinders under forced convection is numerically studied.
- A front-tracking/finite difference method combined with interpolation techniques is used.
- Effects of various parameters on the formation of the solid are investigated.
- Effects of volume change and results in the case of side-by-side arrangement are also presented.
