Taylor bubbles rising through flowing non-Newtonian inelastic fluids

J.D.P. Araújo , J.M. Miranda , J.B.L.M. Campos

PII: S0377-0257(17)30182-9
DOI: [10.1016/j.jnnfm.2017.04.009](https://doi.org/10.1016/j.jnnfm.2017.04.009)
Reference: JNNFM 3891

To appear in: *Journal of Non-Newtonian Fluid Mechanics*

Received date: 18 May 2016
Revised date: 31 March 2017
Accepted date: 24 April 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Validation of the CFD methodology with experimental in-house data was achieved.
- Influence of rheological nature of the liquid on slug flow hydrodynamics is analyzed.
- Shear-thinning promotes larger bubble wakes; shear-thickening does the opposite.
- The presence of a typical STF with mixed behavior in slug flow systems was simulated.
- The predominance of each rheological nature on the main flow regions is detailed.
