This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

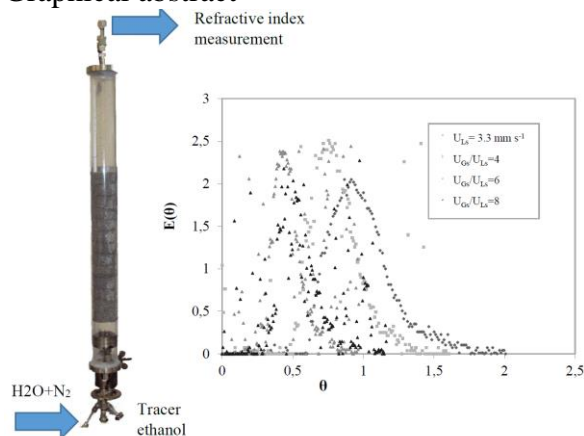

A hydrodynamic study of cylindrical metal foam packings: residence time distribution and two phase pressure drop

Graphical abstract

Research highlights:

- Liquid downward flow through foam packing showed poor spreading
- Measurement of the axial residence time distribution in upward flow through foams
- two phase pressure drop through foams in an upward flow

Nomenclature

Bo	$[u_z l_R D_{ax}^{-1}]$	Bodenstein number
C_j	$[kmol m^{-3}]$	molar concentration of species j
C_j^0	$[kmol m^{-3}]$	molar concentration of species j before inlet
C_j^{in}	$[kmol m^{-3}]$	molar concentration of species j at inlet
C_j^{out}	$[kmol m^{-3}]$	molar concentration of species j at outlet
C_T	$[kmol m^{-3}]$	tracer concentration
D_{ax}	$[m^2 s^{-1}]$	axial dispersion coefficient
d_R	$[m]$	reactor diameter
$E(t)$		probability density function of residence times
