This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- In this paper, we extended and introduced a new algorithm based on reduced and boundary layer correction method for singularly perturbed boundary value problems of fractional order
- The length of boundary layers are approximated by resemblance functions.
- Existence, uniqueness, behavior and stability of solution as well as error estimate of the method are investigated.
- The obtained results confirm that, the workload of the present method descend to determine the numerical layer length, which means that this method is considerable in comparison with other methods.
