This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- Visibility Graph (VG) method was applied for the 2001-2011 seismicity of Corinth rift.
- Using a sliding window approach the exponent γ of the degree distribution of VG was studied.
- A time coincidence exists between the minima of exponent γ and the period when the most significant seismic swarm took place.
