This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A new interface treatment technique for multi-phase meshless methods.
- Interface conditions applied on the interface points in two-phase flows involving interface tension and high viscosity.
- Sharp pressure discontinuity at the interface is well predicted with depressed parasitic current.
- Capable in dealing with high viscosity
- Well performed in simulations of square-droplet deformation, capillary wave, bubble rising and Rayleigh-Taylor instability.
