This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A fully coupled direct-hybrid method for computational aeroacoustics is proposed.
- A CFD and a CAA solver run simultaneously on a joint hierarchical Cartesian grid.
- In-memory data transfers between the solvers greatly improve parallel efficiency.
- The new scheme is validated with the simulation of a pair of co-rotating vortices.
- Performance results show method to be suitable for massively parallel simulations.
