This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We present a method for immersogeometric analysis of flow around complex objects.
- The tetrahedral finite cell method resolves boundary geometry accurately.
- We enforce Dirichlet boundary conditions weakly with Nitsche's method.
- A variational multiscale formulation captures effects of subgrid turbulence.
- The methodology is found effective on a 3D benchmark and an industrial problem.
